

# Pump design

project:

street:

city/postal code:

## Peak extraction

application	calculated flow	x	number	=	volume flow
toilets DIN 19542 3/4" (DN 20)	0,13 l/s	x	<input type="text"/>	=	<input type="text"/> l/s
washing machine 1/2" (DN 15)	0,25 l/s	x	<input type="text"/>	=	<input type="text"/> l/s
pressure flushes 1/2" (DN 15)	0,3 l/s	x	<input type="text"/>	=	<input type="text"/> l/s
pressure DIN 3265 1/2" (DN 15)	1,0 l/s	x	<input type="text"/>	=	<input type="text"/> l/s
taps 1/2" (DN 15)	0,3 l/s	x	<input type="text"/>	=	<input type="text"/> l/s
taps 3/4" (DN 20)	0,5 l/s	x	<input type="text"/>	=	<input type="text"/> l/s
taps 1" (DN 25)	1,0 l/s	x	<input type="text"/>	=	<input type="text"/> l/s

**physical data:**  
 water temperature: 11°C  
 kinematic viscosity: 1,52 mm²/s  
 density: 0,999 kg/dm³  
 steam pressure: 0,0116 bar

**total volume flow** =  $\Sigma$  =  l/s

### suction pipe Duplex-System

suction pipe length and height of a self-priming pump

suction pipe: PE-HD 1"  
 flow rate: 3m³/h

If there is more than one apartment connected to the pump the max volume flow is to be reduced according to the simulate factor:

number of apartments	simultaneous factor
1	1,0
2	0,9
3	0,8
4	0,7
5	0,6
8	0,5
10	0,4
20	0,35

total volume flow  l/s x simultaneous factor  = **peak extraction**  $Q_{max}$   l/s

## Discharge head

$$h_d + (l_d \times 0,2) = H_d$$

$$h_s + (l_s \times 0,2) = {}^*H_s$$

min. flow pressure at tap = 1 bar = **10 m**

**max. discharge head**  ${}^*H_{max}$  =  m

\*If  $H_s$  is 5m, a submersible pump should be used.

## Chosen pump

Typ	$Q_{max}$	$H_{max}$
<input type="text"/>	<input type="text"/> l/s	<input type="text"/> m

# Holding tank design

project:

city/postal code:

## Rainwater yield

### Roof size

The roof size is considered to be the floor space of the house independent of the roof pitch or shape.

### Precipitation

The local precipitation can be taken out of precipitation maps or can be obtained at local weather stations.

### Roof factor

roof material	roof factor
glazed tile	0,9
tile, slate, concrete tile	0,8
gravel flat roof	0,6
planted roof	0,4

$$\text{roof size} \times \text{annual precipitation} \times \text{roof factor} = \text{rainwater yield}$$

m<sup>2</sup> x  l/m<sup>2</sup> x  =  l

## Water needed

application	annual consumption	number of persons	sum
toilet flushing	9.000 l	x <input type="text"/>	= <input type="text"/> l
washing machine	5.000 l	x <input type="text"/>	= <input type="text"/> l
cleaning	1.000 l	x <input type="text"/>	= <input type="text"/> l
garden irrigation	60 l/m <sup>2</sup>	x <input type="text"/>	= <input type="text"/> l
other		x <input type="text"/>	= <input type="text"/> l

**figures for large systems:**  
 school: 1.000 l/persons  
 office: 2.500 l/persons

water needed per year =  $\sum$  =  l

## Dimension

$$\text{calculation factor} \times \text{tank volume factor} = \text{tank volume}$$

l/m<sup>2</sup> x **25 : 365** =  l

The **smaller figure of rainwater yield or water needed per year** is used as **calculation factor**.
